-Difference between import and from import*.

- If I use import module then just now I have the name of the module but I didn't reserve it all in my memory I just reserve what I need to use,so each time I am using any class or object inside it I have to write module_name.class_name.

- If I use from tkinter import * then all the module is reserved now and I can access each class using it's name by writing class_name

-Example for importing

Importing

```
>> import math
>> print math
<module 'math' (built-in)>
>> print math.pi
3.14159265359

>> from math import pi
>> print pi

>> from math import *
>> cos(pi)
```
